Project Title

HOME SCOPE

Abstract:

The home scope application is mainly used for find the rent house. No such system has been developed till now. The aim of this application that the renter can find the home easily. So this application is time consuming.

This application will help find the home in required area easily. Registration must be required for owner and renter. The owner can register to add the details of home like home type, size, available facilities in home, images of home etc. The renter can register to search the home. If home is available according to the renter's requirement, then the renter book the home.

The renter finds the home at particular area but if the home is not available at that time, then he can get the notification when the home is available at that area and he can easily book the rent house.

After book home the owner can see all the details of renter and confirm the renter. After confirmation payment process is done. The admin can also send the notification about home.

It is software developed for windows phone where all the requirement of users is satisfy.
